**Observation:**

During the inspection the firm was observed to have mouse droppings present on the retail sales shelves of pet food, behind bags of pet food. The firm needs to visually inspect all of the retail food product shelves, and remove any pest related debris, droppings loose food products, etc. Shelves need to be cleaned to remove any pest residue or potential sources of contamination. Staff need to be instructed to monitor for indications of pest activity during cleaning or other daily activities, and report the issue to firm management as needed. If pest droppings are present the firm may not be able to determine if pest control activities have been successful.

### **EVALUATION COMMENT**

A complaint was received on 12/08/2025. The complaint alleges that they saw mouse droppings on retail food shelves on multiple occasions. The date related to the complaint was 12/02/2025 (Tuesday the week prior to the complaint).

I conducted an investigation at the store. The store is aware of a rodent problem. They have been working with their pest control company, Eco Lab. The areas identified by the store as being affected are Aisle 9 around the pet food products, Aisle 8 which is adjacent to the pet food aisle, and Aisle 4 the bread aisle. For each aisle the firm has pulled all food products from the lowest shelves. The manager stated that they have traps in place beneath the shelves, accessible by the front kick plates. Eco Lab was in the store for service yesterday and did not report finding any mice in the traps. The pest control company is scheduled to return to the store tomorrow.

During the inspection the pet food aisle was observed to have mouse droppings present on the shelves above the lowest shelf, behind bags of pet food. There were no damaged bags observed during the inspection and minimal loose pet food product, typical to what is observed from normal packaged pet food debris. We discussed the need to have staff pull product from shelves and clean up any mouse droppings. Looking for rodent droppings present is a key aspect to monitoring. Once all droppings are removed, and no additional droppings are observed then it is possible that the infestation has been controlled.

The store has installed brush gap filler on the elevated loading dock spaces at the back dock. The store replaced existing weather stripping along the base of the automated doors at the front of the building. The pest control company is working with the store to help identify possible access points by pests.

No similar complaints have been received against the store at this time. The complaint was made anonymously and I am unable to gather any additional details, nor report out observations from the investigation.
